# Macrophyte Survey Analysis Rice Lake, Barron County WI WBIC: 2103900 July, 2008 

#### Abstract

A point intercept macrophyte survey was conducted on Rice Lake, Barron County Wisconsin (WBIC: 2103900) on July 25-28. An early season survey for Potamogeton crispus was conducted on June 12 and 13. The early survey found expansive, dense coverage of Potamogeton crispus totaling more than 200 acres. The point intercept survey found a total of 56 species of macrophytes and a Simpson's diversity Index of 0.89. The plant coverage is $56.01 \%$ in depths less than plant growth and $45 \%$ in the entire lake. The maximum depth of plants was 16.2 feet, with most plant growth in depths less than 12 feet. The Floristic Quality Index was 36 , with a mean conservatism value of 5.7.

## Introduction

In June and late July 2008, an aquatic macrophyte survey was conducted on Rice Lake (WBIC: 2103900) in Barron County Wisconsin. Rice Lake is a 939 -acre impoundment lake with a maximum depth of 19 feet. The major inlet is the Red Cedar River, which has substantial flow into the lake on the northeast portion of the lake. Development around the lakes is extensive with much of the lakeshore developed and/or disturbed from an original native riparian zone. A large portion of the immediate watershed is urban, with much of the western shore comprised of impervious surface up to or very near the shoreline.

This report presents a summary and analysis of data collected in a baseline aquatic macrophyte survey. The primary goal of the survey is to establish a baseline for long-term monitoring of aquatic plant populations and allow for the evaluation of any changes that may occur long-term. In addition, invasive species presence and locations are key components to a survey of this type. This survey is acceptable for aquatic plant management purposes.

## Field methods

A point intercept method was employed for the macrophyte sampling. The Wisconsin Department of Natural Resources (Wisconsin DNR) generated the sampling point grid of 843 points for Rice Lake. All points were initially sampled until the maximum depth of plants could be established. If no plants were sampled, one sample point beyond that was sampled for plants. In areas such as bays that appear to be under-sampled, a boat survey was conducted. This involved going to the area and surveying that area for plants, recording the species viewed and/or sampled. The type of habitat was also recorded. These data are not used in the statistical analysis nor is the density recorded. Only plants sampled at predetermined sampled points were used in the statistical analysis. In addition, any plant within six feet of the boat was recorded as "viewed." A handheld Global Positioning System (GPS) located the sampling points in the field. The Wisconsin DNR guidelines for point location accuracy were followed with an 80 ft resolution window and the location arrow touching the point.

At each sample location, a double-sided fourteen-tine rake was used to rake a 1 m tow off the bow of the boat. All plants contained on the rake and those that fell off of rake were identified and rated as to rake fullness. The rake fullness value was used based on the criteria contained in the diagram and table below. Those plants that were within six feet were recorded as "viewed," but no rake fullness rating was given.

| Rake fullness rating | Criteria for rake fullness rating |
| :--- | :--- |
| 1 | Plant present, occupies less than $1 / 2$ of tine space |
| 2 | Plant present, occupies more than $1 / 2$ tine space |
| 3 | Plant present, occupies all or more than tine space |
| $v$ | Plant not sampled but observed within 6 feet of boat |

The depth and predominant bottom type was also recorded for each sample point. Caution must be used in using the sediment type in deeper water as it is difficult to discern between muck and sand with a rope rake. All plants needing verification were bagged and cooled for later examination. Each species was mounted and pressed for a voucher collection. On rare occasions a single plant may be needed for verification, not allowing it to be used as a voucher specimen and may be missing from the collection.

## Data analysis methods

Data collected was entered into a spreadsheet for analysis. The following statistics were generated from the spreadsheet:

- Frequency of occurrence in sample points with vegetation (littoral zone) and points shallower than depth of plants
- Relative frequency
- Total points sampled
- Sample points with vegetation
- Simpson's diversity index
- Maximum plant depth
- Species richness
- Floristic Quality Index

An explanation of each of these data is provided below.
Frequency of occurrence for each species- Frequency is expressed as a percentage by dividing the number of sites the plant is sampled by the number of sites. There can be two values calculated for this. The first is the percentage of all sample points that this plant was
sampled at depths less then maximum depth plants were found (littoral zone), regardless if vegetation was present. The second is the percentage of sample points that the plant was sampled at only points containing vegetation. The first value shows how often the plant would be encountered in the defined littoral zone (by depth), while the second value shows if considered where points contain plants. In either case, the greater this value, the more frequent the plant is in the lake. If one wants to compare how frequent in the littoral zone, we look at the frequency of all points below maximum depth with plants. This frequency value allows the analysis of how common plants are where they could grow based upon depth. If one wants to focus only where plants are actually present, then one would look at frequency at points in which plants were found. Frequency of occurrence is usually reported using sample points where vegetation was present.

## Frequency of occurrence example:

Plant A sampled at 35 of 150 littoral points $=35 / 150=0.23=23 \%$
Plant A's frequency of occurrence $=23 \%$ considering littoral zone depths.
Plant A sampled at 12 of 40 vegetated points $=12 / 40=0.3=30 \%$
Plant A's frequency of occurrence $=30 \%$ in vegetated areas
These two frequencies can tell us how common the plant was sampled in the littoral zone or how common the plant was sampled at points plants actually grow. Generally the second will have a higher frequency since that is where plants are actually growing as opposed to where they could grow.

Relative frequency-This value shows, as a percentage, the frequency of a particular plant relative to other plants. This is not dependent on the number of points sampled. The relative frequency of all plants will add to $100 \%$. This means that if plant A had a relative frequency of $30 \%$, it occurred $30 \%$ of the time compared to all plants sampled or makes up $30 \%$ of all plants sampled. This value allows us to see which of the plants are the dominant species in the lake. The higher the relative frequency the more common the plant is compared to the other plants and therefore the more frequent in the plant community.

## Relative frequency example:

Suppose we were sampling 10 points in a very small lake and got the following results:

> Frequency sampled

Plant A present at 3 sites 3 of 10 sites
Plant B present at 5 sites 5 of 10 sites
Plant $C$ present at 2 sites 2 of 10 sites
Plant D present at 6 sites 6 of 10 sites
So one can see that Plant $D$ is the most frequent sampled at all points with $60 \%(6 / 10)$ of the sites having plant D. However, the relative frequency allows us to see what the frequency is compared the other plants, without taking into account the number of sites. It is calculated by dividing the number of times a plant is sampled by the total of all plants sampled. If we add all frequencies $(3+5+2+6)$, we get a sum of 16 . We can calculate the relative frequency by dividing by the individual frequency.

Plant $A=3 / 16=0.1875$ or $18.75 \%$
Plant $B=5 / 16=0.3125$ or $31.25 \%$
Plant $C=2 / 16=0.125$ or $12.5 \%$
Plant $D=6 / 16=0.375$ or $37.5 \%$

Now we can compare the plants to one another. Plant D is still the most frequent, but the relative frequency tells us that of all plants sampled at those 10 sites, $37.5 \%$ of them are Plant D. This is much lower than the frequency of occurrence ( $60 \%$ ) because although we sampled Plant D at 6 of 10 sites, we were sampling many other plants too, thereby giving a lower frequency when compared to those other plants. This then gives a true measure of the dominant plants present.

Number of points sampled- This may not be the same as the total points in the sample grid. When doing a survey, we don't sample at depths outside of the littoral zone (the area where plants can grow). Once the maximum depth of plants is established, many of the points deeper than this are eliminated to save time and effort.

Sample sites with vegetation- The number of sites where plants were actually sampled. This gives a good idea of the plant coverage of the lake. If $10 \%$ of all sample points had vegetation, it implies about a $10 \%$ coverage of plants in the whole lake, assuming an adequate number of sample points have been established. We also look at the number of sample sites with vegetation in the littoral zone. If $10 \%$ of the littoral zone had sample points with vegetation, then the plant coverage in the littoral zone would be estimated at $10 \%$.

Simpson's diversity index-To measure how diverse the plant community is, Simpson's diversity index is calculated. This value can run from 0 to 1.0. The greater the value, the more diverse the plant community is in a particular lake. In theory, the value is the chance that two species sampled are different. An index of " 1 " means that the two will always be
different (very diverse) and a " 0 " would indicate that they will never be different (only one species found). The more diverse the plant community, the better the lake ecosystem.

Simpson's diversity example:
If one sampled a lake and found just one plant, the Simpson's diversity would be " 0 ." This is because if we randomly sampled two plants, there would be a $0 \%$ chance of them being different, since there is only one plant.

If every plant sampled were different, then the Simpson's diversity would be " 1. ." This is because if two plants were randomly sampled, there would be a $100 \%$ chance they would be different since every plant is different.

These are extreme and theoretical scenarios, but they demonstrate how this index works. The greater the Simpson's index is for a lake, the greater the diversity since it represents a greater chance of two randomly sampled plants being different.

Maximum depth of plants-This depth indicates the deepest that plants were sampled. Generally more clear lakes have a greater depth of plants while lower water clarity limits light penetration and reduces the depth at which plants are found.

Species richness-The number of different individual species found in the lake. There is a number for the species richness of plants sampled, and another number that takes into account plants viewed but not actually sampled during the survey.

Floristic Quality Index-The Floristic Quality Index (FQI) is an index developed by Dr. Stanley Nichols of the University of Wisconsin-Extension. This index is a measure of the plant community in response to development (and human influence) on the lake. It takes into account the species of aquatic plants found and their tolerance for changing water quality and habitat quality. The index uses a conservatism value assigned to various plants ranging from 1 to 10. A high conservatism value indicates that a plant is intolerant while a lower value indicates tolerance. Those plants with higher values are more apt to respond adversely to water quality and habitat changes, largely due to human influence (Nichols, 1999). The FQI is calculated using the number of species and the average conservatism value of all species used in the index. The formula is:

## FQI $=$ Mean $\mathbf{C} \cdot \sqrt{ } \mathbf{N}$

Where C is the conservatism value and N is the number of species.
Therefore, a higher FQI, indicates a healthier aquatic plant community. This value can then be compared to the median for other lakes in the assigned eco-region. There are four ecoregions used throughout Wisconsin. These are Northern Lakes and Forests, Northern Central Hardwood Forests, Driftless Area and Southeastern Wisconsin Till Plain. Rice Lake is in the Northern Lakes and Forests-Flowages eco-region.

Summary of Northern Lakes and Forests-Flowages Median Values for Floristic Quality Index:
(Nichols, 1999)
Mean species richness $=23.5$
Mean conservatism $=6.2$
Mean Floristic Quality $=28.3^{*}$
*Floristic Quality has a correlation with area of lake (+), alkalinity(-), conductivity (-), $\mathrm{pH}(-)$ and Secchi depth (+). In a positive correlation, as that value rises so will FQI, while with a negative correlation, as a value rises, the FQI will decrease.

## Results

The Wisconsin Department of natural resources generated a 843 point grid for sampling (Figure 1). Of these points, 675 were sampled for plants due to water depth and established depth of plant growth. Points in areas far exceeding maximum depth of plants, and some points in two bays that were too shallow, were not sampled.

In Rice Lake, 358 points had vegetation. This represents approximately $43.7 \%$ of the lake with vegetation and $55.9 \%$ of the littoral zone with plants (depths less then deepest with plants). See Figure 2 to view a map of the points with vegetation. The most east bay on the north end had very high diversity of plants, many of which are emergent or floating species. Many points could not be sampled here due to the shallow depths and the extensive plant growth. It is possible more new species are present but weren't sampled.

The bay on the west shoreline near the hospital was very dense with plants. A large area of cattail dominates the bay with a large area not navigable. A few points could not be sampled here due to shallow depths, but many plants were present.

Figure 1: Sample point grid for Rice Lake
The greatest depth with plants sampled was 16.2 feet. This indicates that the water clarity allows enough light penetration through much of the growing season to 16 feet. Most points this deep did not have plant growth and the vast majority of the plant growth was less than 12 feet. This observation is consistent with the limited water clarity observed during the survey dates.

| SUMMARY STATS | $\mathbf{8 4 3}$ |
| :--- | ---: |
| Total number of points | 368 |
| Total number of sites with vegetation | 658 |
| Total number of sites shallower than maximum depth of plants | $\mathbf{5 5 . 9 \%}$ |
| Frequency of occurrence at sites shallower than maximum depth of plants | $\mathbf{4 3 . 7 \%}$ |
| Frequency of occurrence at all sites (based upon maximum depth of plants) | $\mathbf{1 6 . 2}$ |
| Maximum depth of plants (ft) | $\mathbf{3 . 5 2}$ |
| Average number of all species per site (veg. sites only) | $\mathbf{3 . 4 2}$ |
| Average number of native species per site (veg. sites only) | $\mathbf{0 . 8 9}$ |
| Simpson Diversity Index | $\mathbf{4 1}$ |
| Species Richness | 56 |
| Species Richness (including visuals) |  |

Table 1: Summary of survey statistics

Figure 2: Map of sample points with vegetation present
The most common sediment type was rock. Determining the sediment type during a plant survey is difficult as a rake and sight are used to determine the dominant sediment. As a result, deeper areas are difficult. However, rock was very common and easier to discern from muck and sand. There seems to be thin layer of muck over the rock in many areas. In addition, many of the bays had predominantly muck sediments and near the mouth of the Red Cedar River. The points not sampled have no sediment type recorded.

Figure 3: Predominant sediments at sample points

Several sample points had no plants while some points had high diversity. Figure 4 is a map of diversity at locations plants were sampled. The predominant diversity seems to occur in the north end (Stump Lake region), in the sediment outflow at the mouth of the Red Cedar River, and two bays in the southern end of the lake. Most of these areas have suitable substrate for plant growth with high nutrient substrates (muck) in these areas (Figure 3).

Figure 4: Map of species richness at sample points

Rice Lake has high plant diversity as demonstrated by the survey results. There were 41 species of macrophytes sampled during this survey. An additional 15 species were viewed within six feet of the surveyor but not sampled on the rake. This gives a total of 56 species either sampled or viewed. Of these 56 species, 54 are native species, 2 are non-natives, 4 are algae species and 52 are vascular plants. Curly leaf pondweed (Potamogeton crispus) and Aquatic for-get-me-not (Myosotis scorpioides) are the two non-native species sampled and viewed respectively. No endangered, threatened or species of concern were sampled or viewed in the survey.

The Simpson's diversity index is 0.89 . This is quite high and demonstrates that it is very likely that two randomly sampled plants will be different species.

| Species | Frequency of occurrence within vegetated areas (\%) | Frequency of occurrence shallower than max depth of plants(\%) | Relative Frequency (\%) | Number of sites where species found | Average Rake Fullness |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Ceratophyllum demersum,Coontail | 86.14 | 48.25 | 24.52 | 317 | 1.39 |
| Elodea canadensis,Common waterweed | 44.84 | 25.11 | 12.76 | 165 | 1.10 |

| Typha latifolia,Broad-leaved cattail | $\mathbf{1}$ |

Table 3: List of species viewed only

The most frequently sampled plant on Rice Lake was coontail (Ceratophyllum demersum). This plant had a high frequency of occurrence at $85.14 \%$. This may indicate high nutrients in Rice Lake as a high frequency of occurrence and high relative frequency of coontail shows its prevalence. A high relative abundance in coontail can be due to high nutrients since it has an ability to absorb large amounts of phosphorus from the water column (Borman, 1997). Coontail is a desirable plant with fine leaves providing good invertebrate and fish habitat. It also tends not to senesce in the winter months, providing key limited winter habitat. However, it can reach nuisance levels in some high nutrient lakes. Although it is very common in Rice Lake, and several points had a density of three, no areas seemed to be nuisance levels needing management.

Figure 5: Map of Certophyllum demersum (coontail)distribution

Common waterweed (Elodea Canadensis) is the second most frequent plant in Rice Lake. This plant is also a desirable native in Wisconsin Lakes. It too can grow into fairly dense mats in high nutrient conditions but this was not apparent in Rice Lake. Common waterweed is good fish grazing areas and continues to photosynthesize in the winter months, adding oxygen to the water.

Figure 6: Map of Elodea canadensis (common waterweed) distribution

Another plant with high relative frequency was flat-stem pondweed (Potamogeton zosteriformis), being the third most frequent plant sampled. Flat-stem pondweed is good cover for fish and invertebrates. Flat-stem pondweed is also an important food source for waterfowl, muskrats, deer and beaver.

Figure 7: Map of Potamogeton zosteriformis (flat-stem pondweed) distribution

## Floristic Quality Index

The Floristic Quality Index uses the plant species surveyed in and around a lake to indicate the lake's response to human development through habitat, sediment, and/or water quality changes. The FQI is based upon the number of plants sampled (that are used in the FQI) and the mean conservatism values. The greater the number of species and the greater the mean conservatism of the plants sampled the higher the FQI. A low FQI value can indicate habitat degradation, substrate changes and/or water quality changes that are adverse to sensitive plants. As these changes occur (largely due to human activity), these more sensitive plants become less prevalent and therefore are not sampled. FQI should be used with caution for evaluating water quality, especially in relation to excess nutrients. Excess nutrients will reduce water quality, but may not be reflected in the FQI.

| FQI Species | Common name | Conservatism |
| :--- | :--- | ---: |
| Brasenia schreberi | Watershield | 7 |
| Ceratophyllum demersum | Coontail | 3 |
| Calla palustris | Wild calla | 9 |
| Carex camosa | Bottle brush sedge | 5 |
| Chara sp. | Muskgrasses | 7 |
| Dulichium arundinaceum | 3-way sedge | 9 |
| Elodea canadensis | Common waterweed | 3 |
| Elodea nuttallii | Slender waterweed | 7 |
| Lemna minor | Small duckweed | 5 |
| Lemna trisulca | Forked Duckweed | 6 |
| Megalodonta beckii | Water marigold | 8 |
| Myriophyllum sibericum | Northern water-milfoil | 7 |
| Najas flexilis | Bushy pondweed | 6 |
| Najas gracillima | Slender water-nymph | 7 |
| Nitella sp. | Nitella | 7 |
| Nuphar variegata | Spatterdock | 6 |
| Nymphaea odorata | White water lily | 6 |
| Pontaderia cordata | Pickerelweed | 6 |
| Potamogeton amplifolius | Large-leaf pondweed | 9 |
| Potamogeton epihydrus | Ribbon-leaf pondweed | 7 |
| Potamogeton foliosus | Leafy pondweed | 8 |
| Potamogeton friesii | Frie's pondweed | 6 |
| Potamogeton natans | Floating-leaf | 8 |
| Potamogeton praelongis | White-stem pondweed | 5 |
| Potamogeton pusillus | Small pondweed | 8 |
| Potamogeton richardsonii | Clasping-leaf pondweed | 7 |
| Potamogeton robbinsii | Robbins pondweed | 5 |
| Potamogeton zosteriformis | Flat-stem pondweed | 8 |

| FBI species continued |  |  |
| :--- | :--- | ---: |
| Ranunculus aquatilis | Stiff water crowfoot | 7 |
| Sagittaria graminea | Grass-leaved arrowhead | 9 |
| Sagittaria latifolia | Common arrowhead | 3 |
| Schoenoplectus acutus | Hardstem bulrush | 5 |
| Schoenoplectus | Softstem bulrush | 4 |
| tabernaemontani | Common bur-reed | 5 |
| Sparganium eurycarpum | Large Duckweed | 5 |
| Spirodela polyrhiza | Sogo pondweed | 3 |
| Stuckenia pectinata | Narrow-leaved cattail | 1 |
| Typha angustifolium | Broad-leaved cattail | 1 |
| Typha latifolia | Creeping bladderwort | 9 |
| Utricularia gibba | Common bladderwort | 7 |
| Utricularia vulgaris | Wild celery | 6 |
| Vallisneria americana | Common watermeal | 5 |
| Wolffia columbiana | Water star-grass | 6 |
| Heteranthera dubia |  |  |

Table 4: FQI species list with conservatism values
In calculating the FQI, 43 species were used with a mean conservatism value of 6.07. These values resulted in a FQI of $39.8^{1}$. When compared to the median FQI values obtained from lakes researched in the same eco-region in 1999 (Nichols, 1999), Rice Lake is higher in two of three values. The median number of species sampled (used in FQI) for this eco-region is 23.5 compared to 36 for Rice Lake. The median mean conservatism value for the eco-region lakes is 6.2 and is slightly lower for Rice Lake at 6.07. Lastly, the median FQI for lakes in the eco-region is 28.3 and Rice Lake is higher at 39.8. The larger plant diversity accounts for the higher FQI in Rice Lake compared to the eco-region lakes.

| FQI Values | Rice Lake | Eco-region median |
| :--- | :--- | :--- |
| Number of species | 43 | 23.5 |
| Mean Conservatism | 6.07 | 6.2 |
| FQI | 39.8 | 28.3 |

Table 5 : FQI values and eco-region median

## Non-native and aquatic invasive species

One non-native species, Aquatic for-get-me-not was viewed. The Aquatic-for-get-me-not was viewed near the shoreline at one sample point. This plant is not frequent on Rice Lake and should not be considered a major threat. However, this plant should be monitored.

The other non-native species was curly leaf pondweed (CLP) and should be considered invasive. The CLP grows very dense and is expansive on Rice Lake. There were several

[^0]beds (totaling 12.1 acres) that had an average rake density of less than 2 . There is an extremely large coverage ( 199.26 acres) of CLP beds with a mean rake density greater than two. This coverage encompasses a very large portion of the lake with CLP plants reaching the surface and reaching nuisance levels in many areas.

CLP grows best in the colder water of spring and early summer, undergoing senescence by early to mid July. CLP was still sampled at numerous locations in late July.

Figure 8: Map of CLP distribution from July survey 2008

## Rice Lake CLP Bed Map

Figure 9: Map of CLP beds in June 2008

## Recommendations

Rice Lake has a very diverse, healthy plant community. Fish and key organisms such as invertebrates rely on native plants for survival. In addition, excess nutrients can be a concern in impoundment lakes such as Rice Lake. As a result, the plant community can help maintain water quality in Rice Lake through assimilation of excess nutrients that would otherwise be available for nuisance algae growth. It is important that the native plant community be preserved and monitored periodically in the future.

The non-native plant curly leaf pondweed needs to be managed. It is growing to nuisance levels in Rice Lake. It is probable that it is affecting early season growth of native plants due to the density of the CLP growth through June. In addition, it could also be adding a large phosphorus load to the lake when senescence occurs in July. If reduction can be successful, native plants may replace the CLP growth and reduce excess nutrients and reduce sudden habitat losses in the middle of summer. Management practices must be used that will target CLP and have limited affect on the native plants.

## Appendix B

## Glossary

Community-Different populations interacting.
Ecosystem-Any complex of living organisms together with all biotic and abiotic (nonliving) factors which affect them.

Emergent plant-Aquatic plants that are rooted or anchored in sediment and have stems and leaves extending well above the water surface.

Floating-leafed plant-Plants with leaves floating on the water surface and are rooted or attached to sediments by long, flexible stems.

Habitat-The physical place where an organism lives.
Herbarium-A collection of plants sampled.
Littoral zone-The region of a body of water extending from the shoreline outward to the greatest depth occupied by rooted aquatic plants.

Macrophyte-Large, rooted or floating aquatic plants that may bear flowers and seeds. Some plants are free floating and are not attached to the bottom.

Nutrient-Any chemical element, ion or compound required by an organism for the continuation of growth, reproduction, and other life processes.

Photosynthesis-Production of organic matter (carbohydrate) from inorganic carbon and water in the presence of light.

Sediment-Solid material deposited in the bottom of a basin.
Submergent plant-Aquatic plant that grows with all or most of its stems and leaves below the water surface.

Voucher-A collection of specimens sampled in a particular location.
Watershed-The entire surface landscape that contributes water to a lake or river.

# Appendix A-Maps of species and locations <br> Species occur in order listed below 

Aquatic moss
Asclepias incarnata, Swamp milkweed
Brasenia schreberi,Watershield
Calla palustris, Wild calla
Carex comosa,bottle brush sedge
Carex sp.
Ceratophyllum demersum,Coontail
Chara ,Muskgrasses
Comarum palustris, Marsh cinqufoil
Decodon verticillatus,Swamp loosestrife
Dulichium arundinaceum,3-way sedge
Eleocharis palustris,creeping spikerush
Elodea canadensis,Common waterweed
Elodea nuttallii,Slender waterweed
Filamentous algae
Heteranthera dubia,Water star-grass
Hydrodictyon sp., Waternet
Iris versicolor, Northern Blue flag
Juncus effusus,Soft rush
Lemna minor,Small duckweed
Lemna trisulca,Forked duckweed
Megalodonta beckii,Water marigold
Myosotis scorpioides, Aquatic for-get-me-not
Myriophyllum sibiricum,Northern water milfoil
Najas flexilis,Bushy pondweed
Najas gracillima,Northern naiad
Nitella sp.,Nitella
Nuphar variegata,Spatterdock
Nymphaea odorata, White water lily

Pontederia cordata,Pickerelweed
Potamogeton amplifolius,Large-leaf pondweed
Potamogeton crispus,Curly-leaf pondweed
Potamogeton epihydrus,Ribbon-leaf pondweed
Potamogeton foliosus,Leafy pondweed
Potamogeton friesii,Frie's pondweed
Potamogeton natans,Floating-leaf pondweed
Potamogeton praelongis,White-stem pondweed
Potamogeton pusillus,Small pondweed
Potamogeton richardsonii,Clasping-leaf pondweed
Potamogeton robbinsii,Robbins pondweed
Potamogeton zosteriformis,Flat-stem pondweed
Ranunculus aquatilis,Stiff water crowfoot
Sagittaria graminea,Grass-leaved arrowhead
Sagittaria latifolia,Common arrowhead
Sagittaria sp.(rosette)
Schoenoplectus acutus,Hardstem bulrush
Schoenoplectus tabernaemontani,Softstem bulrush
Sparganium eurycarpum,Common bur-reed
Spirodela polyrhiza,Large Duckweed
Stuckenia pectinata,Sago pondweed
Typha angustifolia,Narrow-leaved cattail
Typha latifolia,Broad-leaved cattail
Utricularia gibba,Creeping bladderwort
Utricularia vulgaris,Common
Vallisneria americana,Wild celery
Wolffia columbiana,Common watermeal
